This construct is used to determine the ability of H11-scFV antibody fragments to bind specifically to the C-antigen on cancer cells such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polynucleotide sequence may be used as primer or a probe and the encoded protein may be used in a vaccine or gene therapy. The human monoclonal antibody (MAb), designated H11, specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma, lung adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antigen binding fragment from monoclonal antibody, H11 - allows tumour specific detection and treatment of neoplasia.
                                                               601

The present DNA sequence encodes human monoclonal antibody (Mab), H11-single chain variable region (scFv). The H11 light chain variable region is linked to the heavy chain variable region through a (SGGGG)3 linker to

Composition comprising antigen binding fragments of an antibody that recognizes an antigen on neoplastic cells but not on normal cells foin diagnosis, imaging and treatment of carcinomas.

The invention relates to human monoclonal antibody (Mab) H11, H11-(scPv) single chain variable (V) region fragment and their corresponding DNA molecules. H11 antibody is an immunoglobulin of IgM subclass which is specific to C-antigen found specifically on neoplastic cells and not on normal cells. H11 is an antibody obtained from the fusion of peripheral blood lymphocytes of a 64 year old male with a low grade glioma and fused to a human myeloma cell line to produce a hybridoma designated NBGM1/H11. A pharmaceutical composition comprising H11 and its derivatives are useful in the diagnosis, imaging and treatment of neoplastic disease, particularly, melanoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon carcinoma, gastric carcinoma, prostate carcinoma, small cell lung carcinoma, neuroblastoma, glioma, soft tissue sarcoma, small cell lung carcinoma, prostatic adenocarcinoma, sand Togo there we have a charactic carcinoma and control cell lung carcinoma. H11 DNA is also used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                    541

The invention relates to a polypeptide which is an antigen binding tragment of a monoclonal antibody specific for an antigen detected on neoplastic cells. The antigen binding fragment (ABF) is useful for treating a patient with a neoplasia. The individual has a clinically detectable tumour. The method is useful for palliating the neoplasia. The method reduces the risk of recurrence of a clinically detectable tumour. The antigen binding fragment is labelled with a therapeutic molety such as radioisotopes or immunomodulators. ABF is useful for detecting C-

antigen in a sample. The polypeptide is useful for diagnosing, localising and/or treating neoplasias, including melanoma, neuroblastoma, glioma, soft tissue sarcoma and small cell lung carcinoma. The polypeptide is useful for manufacturing novel reagents and for treating and imaging composition is useful as a diagnostic and imaging reagent. The composition is useful as a diagnostic and imaging reagent. The polymuclectide is useful in expression systems for the production of C-antigen specific antibody, termed H11 or alphaC, as hybridisation of probes to assay for the presence of alphaC polymuclectide or related sequences in a sample, as primers to effect amplification of desired polymuclectides and in pharmaceutical compositions including vaccines and for gene therapy. The polymuclectide is also useful for genetically altering cells in vivo, thus treating various types of cancer. The polypeptide, polymuclectide and the composition are useful for detecting or treating cancer, including therapy of cancer and prophylactic care, particularly for decreasing the risk of recurrence. The present sequence represents the human C-antigen specific antibody H11 single chain carriable region fragment, scFv, #1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Š
The invention relates to a composition comprising an antigen binding fragment of an antibody comprising H chain V region and L chain V rethat specifically recognises Cantigen. The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types
                                                                                                                                                                                                 Composition useful for treating neoplasia in patient, comprises antigen binding fragment of antibody specifically recognizing C-antigen recognized by antibody comprising H chain V region and L chain V region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA
```

CC The present sequence is human monoclonal antibody (Mab), H11-single chain CC variable region (scFv) complementary DNA. The invention relates to human CC monoclonal antibody (Mab) H11, H11-(scFv) single chain variable (V) CC region fragment and their corresponding DNA molecules. H11 antibody is an CC immunoglobulin of IgM subclass which is specific to C-antigen found ce specifically on neoplastic cells and not on normal cells. H11 is an CC antibody obtained from the fusion of peripheral blood lymphocytes of a 64 CC year old male with a low grade glioma and fused to a human myeloma cell CC line to produce a hybridoma designated NBGM1/H11. A pharmaceutical CC composition comprising H11 and its derivatives are useful in the CC diagnosis, imaging and treatment of neoplastic disease, particularly, CC melanoma, breast carcinoma, prostate carcinoma, Iung carcinoma, carcinoma, CC carcinoma, glioma, soft tissue sarcoma, small cell lung carcinoma, CC prostatic adenocarcinoma, B and T cell lymphoma carcinoma in prostatic adenocarcinoma, B and T cell lymphoma carcinoma composition control in varcinoma and cane therapy DNA is also used in vaccines and gene therapy

The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of tantibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFv) complementary DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-MAY-1996;

```
Antigen binding fragment from monoclonal antibody, H11 - allows tumour specific detection and treatment of neoplasia.
```

Example 7; Page 94-95; 126pp; English

This sequence encodes a human H11 monoclonal antibody single chain V region fragment (H11-scFV) construct which is capable of forming dimers. This construct is used to determine the ability of H11-scFV antibody fragments to bind specifically to the C-antigen on cancer cells. Such antigen binding fragments may be used for treating a patient with neoplasia. It is especially useful in the detection of lymphomas and leukaemias where the tumour cells bearing the C antigen are circulating in the patients bloodstream. The polymucleotide sequence may be used as a primer or a probe and the encoded protein may be used in a vaccine or for specifically recognises cancerous cells. H11 is specific for glioblastoma, neuroblastoma, malignant melanoma, breast adenocarcinoma and protein may adenocarcinoma, small cell lung carcinoma, colon adenocarcinoma and prostate adenocarcinoma

single chain variable region (scPv). The H11 light chain variable region is linked to the heavy chain variable region through a (SGGGG)3 linker to form dimers. The invention relates to human monoclonal antibody (Mab) H11, H11-(scPv) single chain variable (V) region fragment and their corresponding DNA molecules. H11 antibody is an immunoclonal corresponding DNA molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; monoclonal antibody; Mab; H11; single chain variable region; scFv neoplastic disease; melanoma; immunoglobulin IgM; gene therapy; lymphoma carcinoma; breast; lung; gastric; prostate; ovary; colon; lung; vaccine; neuroblastoma; soft tissue sarcoma; prostatic adenocarcinoma; cytostatic C-antigen; chronic leukaemia; glioma; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     04-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAD04539

subclass which is specific to C-antigen found specifically on neoplastic cells and not on normal cells. Hil is an antibody obtained from the fusion of peripheral blood lymphocytes of a 64 year old male with a low grade glioma and fused to a human myeloma cell line to produce a hybridoma designated NBGM1/Hil. A pharmaceutical composition comprising Hil and its derivatives are useful in the diagnosis, imaging and treatment of neoplastic disease, particularly, melanoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon carcinoma, gastric carcinoma, prostate carcinoma, lung carcinoma, prostate carcinoma, soft tissue sarcoma, small cell lung carcinoma, prostate adenocarcinoma, B and T cell lymphomas and chronic leukaemias. Hil DNA is also used in vaccines and gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
The invention relates to a polypeptide which is an antigen binding fragment of a monoclonal antibody specific for an antigen detected on neoplastic cells. The antigen binding fragment (ABF) is useful for treating a patient with a neoplasia. The individual has a clinically detectable tumour. The method is useful for palliating the neoplasia. The method reduces the risk of recurrence of a clinically detectable tumour. The antigen binding fragment is labelled with a therapeutic moiety such as radioisotopes or immunomodulators. ABF is useful for detecting Cantigen in a sample. The polypeptide is useful for diagnosing, localisin and/or treating neoplasias, including melanoma, neuroblastoma, glioma, soft tissue sarcoma and small cell lung carcinoma. The polypeptide is
                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antigen binding fragment of monoclonal antibody specific for antigen detected on neoplastic cells, useful for diagnosing or treacancer, for manufacturing novel reagents and as diagnostic and image
                                                                                                                                                                                                                                                                                                                                              Example 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc useful for manufacturing novel reagents and for treating and imaging cc brain cancer. ABF is useful as a diagnostic and imaging reagent. The cc composition is useful for eliciting an immune response against neoplasia. The polynuclectide is useful in expression systems for the production of c c-antigen specific antibody, termed H10 or alphaC, as hybridisation of crobes to assay for the presence of alphaC polynuclectide or related sequences in a sample, as primers to effect amplification of desired compositions including vaccines and compositions including vaccines and compositions including vaccines and compositions including vaccines and composition of cancer. The polynuclectide is also useful for genetically calls in vivo, thus treating various types of cancer. The polynuclectide and the composition are useful for detecting composition are useful for detecting converting cancer, including therapy of cancer and prophylactic care, comparational properties and the rest of recurrence. The present sequence represents the human c-antigen specific antibody H11 single chain types of carcer argines to the sum of the risk of recurrence. The present sequence represents the human c-antigen specific antibody H11 single chain types.

            The invention relates to a composition comprising an antigen binding fragment of an antibody comprising H chain V region and L chain V region that specifically recognises C-antigen. The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of the antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types of cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFV) DNA.
                                                                                                                                                                                                                                                                          Composition useful for treating neoplasia in patient, comprises antigen binding fragment of antibody specifically recognizing C-antigen recognized by antibody comprising H chain V region and L chain V region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antigen binding fragment; H chain V region; L chain V neoplasia; cancer; vaccine; gene therapy; human; single chain V region fragment; scFv; gene; ds.

The invention relates to human monoclonal antibody (Mab) H11, H11-(gcFv) single chain variable (V) region fragment and their corresponding DNA molecules. H11 antibody is an immunoglobulin of IgM subclass which is specific to C-antigen found specifically on neoplastic cells and not on normal cells. H11 is an antibody obtained from the fusion of peripheral blood lymphocytes of a 64 year old male with a low grade glioma and fused to a human myeloma cell line to produce a hybridoma designated NBGM/H11. A pharmaceutical composition comprising H11 and its derivatives are useful in the diagnosts, imaging and treatment of neoplastic disease, particularly, melanoma, breast carcinoma, lung carcinoma, ovarian carcinoma, colon
                                                                                                                                                                                                                                                                                                            Sequence 867 BP; 189 A; 241 C; 229 G; 208 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                         carcinoma, gastric carcinoma, prostate carcinoma, lymphoma carcinoma, neuroblastoma, glioma, soft tissue sarcoma, small cell lung carcinoma prostatic adenocarcinoma, B and T cell lymphomas and chronic leukaemi H11 DNA is also used in vaccines and gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising antigen binding fragments of an antibody that recognizes an antigen on neoplastic cells but not on normal cells for in diagnosis, imaging and treatment of carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; monoclonal antibody; Mab; H11; single chain variable region; scFv; neoplastic disease; melanoma; immunoglobulin IgM; gene therapy; lymphoma; carcinoma; breast; lung; gastric; prostate; ovary; colon; lung; vaccine; neuroblastoma; soft tissue sarcoma; prostatic adenocarcinoma; cytostatic; C-antigen; chronic leukaemia; glioma; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising an antigen binding fragment of an antibody comprising H chain V region and L chain V region that specifically recognises C-antigen. The invention is useful for treating a patient with a neoplasia. The antigen binding fragment of the antibody is used as diagnostic and imaging reagents. The invention is useful for genetically altering cells in vivo, to treat various types of cancer. It is also useful in vaccine and gene therapy. The present sequence is human antibody H11 single chain V region fragment (scFV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (DANM/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         by a His6 tag and haemagglutinin tag. The gene was used in examples from the invention describing the construction or Fab expression constructs. The invention relates to the T7 bacteriophage display of Fab fragments. Host cells and methods of making the phage are described. A claimed process for producing a Fab T7 phage display vector comprises: providing, in the genome of a T7 phage, a first nucleic acid construct containing nucleic acids encoding a light chain fused to a T7 capsid protein (preferably 10A or 10B) under regulatory control of a first promoter; and providing, in the genome of the T7 phage, a second nucleic acid construct containing nucleic acids encoding a heavy chain for under the control of a second promoter, which may be the same or different from the first
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mapping epi

The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CH1-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly) peptides having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HD70; single-chain variable fragment; scFv; 17-1A antigen; human; EpCAM; epithelial cell'adhesion molecule; inflammatory cytokine; IL-2; interleukin-2; Ck-domain; kappa light chain constant domain; heterominibody; multifunctional compound; immunoglobulin; cytostatic; immunostimulatory; antileukaemia; diagnosis; prevention; antiproliferative; treatment; malignant; haematopoietic cell; lymphoma; antiproliferative; treatment; malignant; haematopoietic cell; lymphoma;

The heterominibodies have cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoletic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas. The present sequence is a DNA encoding right chain of a heterominibody comprising HD70 single-chain Fv (scFv) fragment N-terminally linked to human Ck domain (constant domain of immunoglobulin -kappa light chain) which bears at its C-terminus the human inflammatory cytokine interleukin-2 (IL-2). HD70 scFv specifically recognises the human epithelial cell adhesion molecule (EpCAM) also called 17-1A antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1630 BP; 445 A; 410 C; 408 G; 367 T; 0 U; 0 Other;

The patent discloses heterominibodies which are multifunctional compounds comproduceable in a mammalian host cell as a secretable and fully functional content of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, considered to the constant domains at least two (poly)peptides having confidered treesptor or ligand functions, where further at least two of the constant domains at least two (poly)peptides having confidered two constant domains. The heterominibodies have constant domains. The heterominibodies have continulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and confidered to malignant cell growth related to malignancies of haematopoietic confidered to malignancies of haematopoietic human inflammatory cytokine granulocyte/macrophage colony stimulating factor (GM-CSF), plus a hexahistidine sequence for ease of purification. HD70 scFv specifically recognises the human epithelial cell adhesion molecule (EpCAM) also called 17-1A antigen
